

## Overview

MacB has a combined set of research and development, test and mid-rate production lab facilities exceeding 100,000 sq. ft. These laboratories and manufacturing shops are a key component to our engineering and high-value added work for national security customers. Having multiple facilities in different geographic locations, allows us to provide cost efficient and effective lab operations close to those customers who need it most.

Our laboratories support the entire life cycle—development through fielding of solutions—and we can accommodate a variety of missions with facilities cleared from unclassified to SCIF accreditation.
